

AIR SHOWER

AIR SHOWER

WHAT IT'S FOR

The Air Shower allows your workers to remove dust from themselves when exiting dusty areas. This minimises cross contamination between people and products, and reduces risks associated with dust exposure.

ADVANTAGES

- Using only high-efficiency filtered air to blow you clean
- Reduces the risks associated with dust exposure to both the respiratory system and skin contact
- The principle can be extended to larger volumes of people or products
- Reduces cross contamination between people and products
- Single or multiple user cubicles
- Effective in cleaning raw materials prior to entry into manufacturing
- Hand-held air brush blower for releasing stubborn deposits

HOW IT WORKS

The Air Shower uses high velocity jets to blow a stream of air onto workers or products before they enter a clean space or exit a dusty area. Particulate contaminants are quickly and efficiently removed. A second option has been developed to vacuum particles from products, people and clothing.

APPLICATIONS

- Laboratories
- Pharmaceutical Manufacturing
- Heavy industry and mines
- Facilities with dangerous substances and heavy metals
- Cement Factories
- Clean-room electronics
- Food Production
